

TurtleStitch

Making repeating designs and design for backing material

Hans de Jong

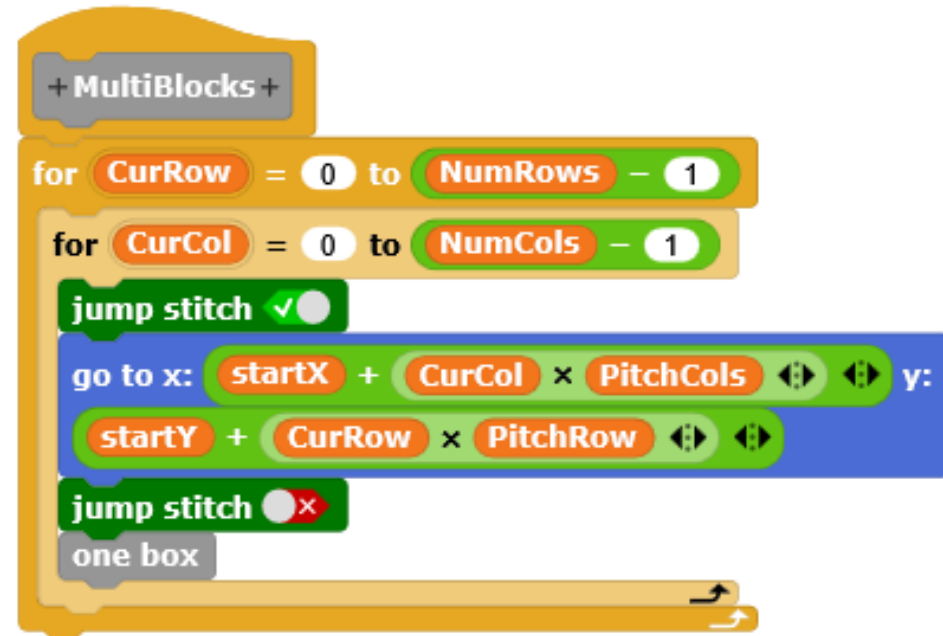

Making repeating designs

The original that
Susan Ettenheim requested
help for
(also note the jump stitches)

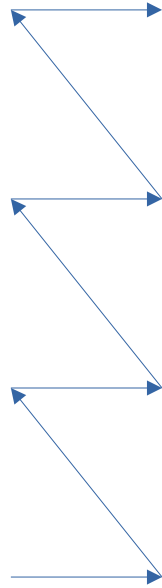

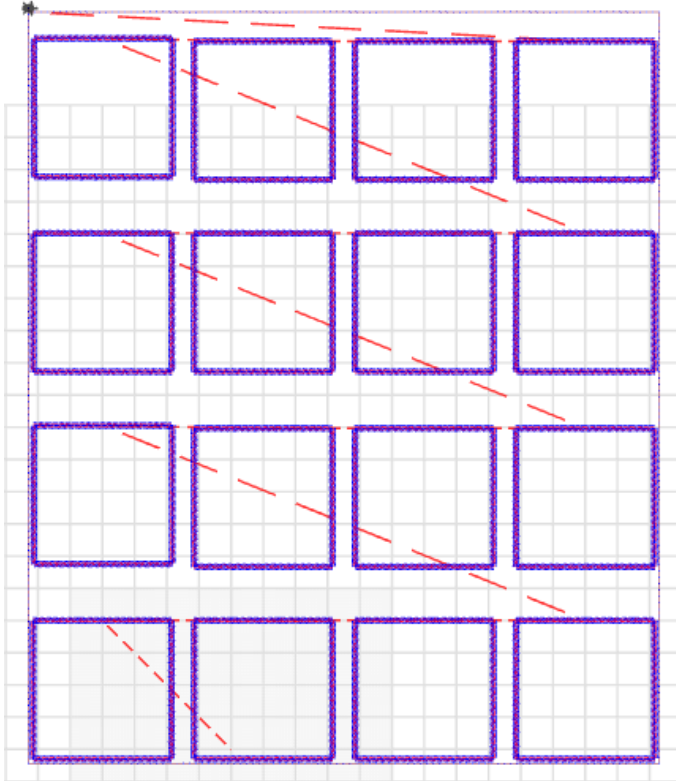

How to make designs with multiple repeating subdesigns

- 1) Make a single design that is only using relative coordinates (only relative to a startingpoint)
- 2) Use nested *for* blocks

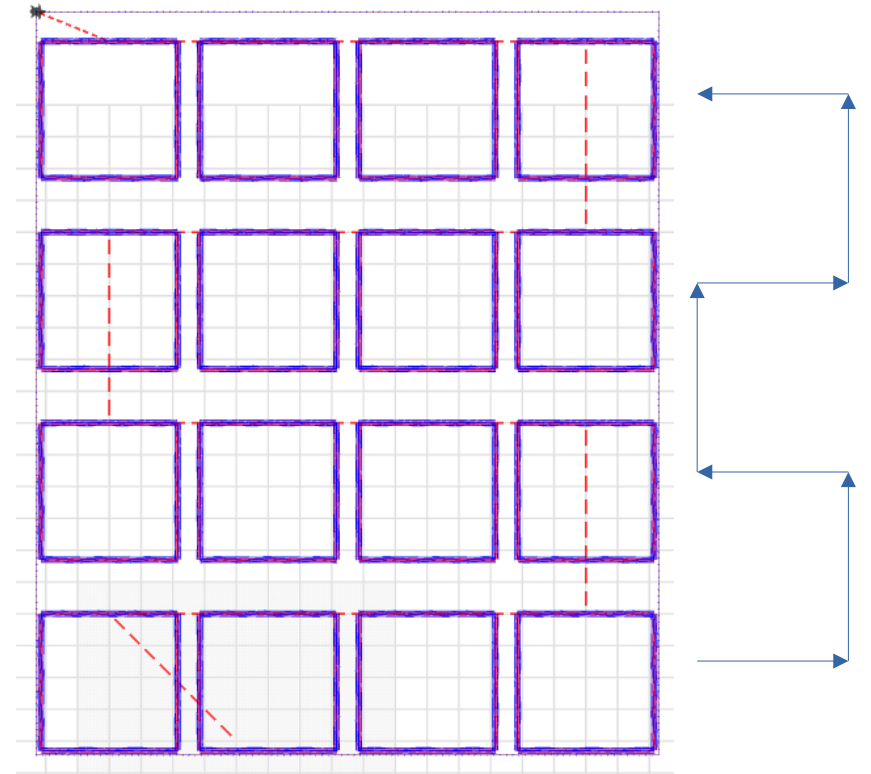

Avoiding long jump stitches

Instead of this ...

... do this

Therefore this
is the code for
moving through
rows and
columns

This if statement is added to limit the length of jump stitches by alternatingly go left to right and right to left for every other row

Use backing material: the intent

- Hide the jump stitches at the back of the fabric
- Embroider a design
- Stop the embroidery machine
- Tape a piece of fabric to the back of the hoop
- Embroider a second part on both front and back together
- Issue: how to design the second part and position it at the exactly the right place

Get first and second design out of one TurtleStitch program

- Use a switch in the design to determine which elements to include

```

+ one + box +
script variables TopX TopY
set TopX to x position
set TopY to y position
if OutlineOnly = False
  running stitch by 10 steps
else
  satin stitch with width 8 center
first_box
if OutlineOnly = False
  go to x: TopX + 0 y: TopY + 5
hole
pen up
go to x: TopX + -60 y: TopY + -50
pen down
hsfi
pen up
go to x: TopX + -50 y: TopY + -200
pen down
2030
pen up
go to x: TopX + 0 y: TopY + -80
pen down
heart

```

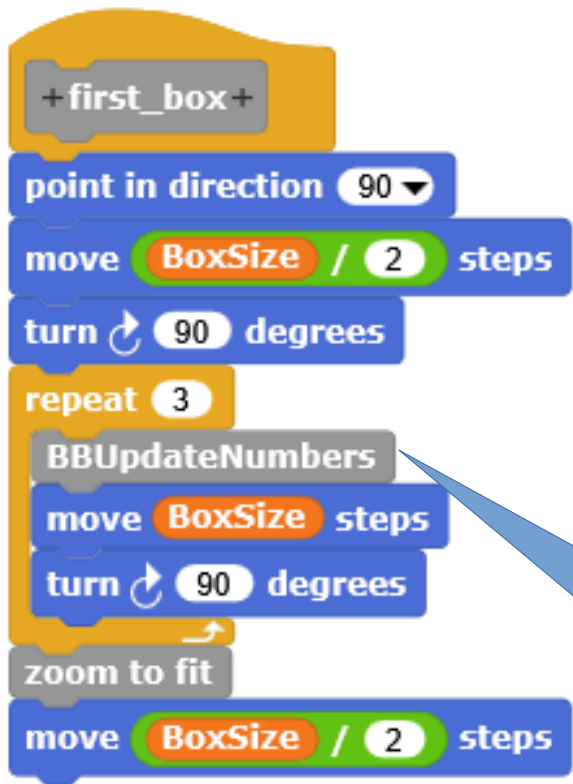

Remember the start position

Always embroder the box, the stitch type depends on OutlineOnly being True or False

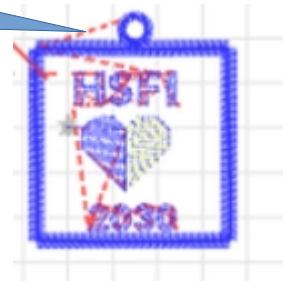

Skip the next elements if designing only the outline

Do all gotos relative to the start position

One more jump stitch avoidance: Start the box on the middle top

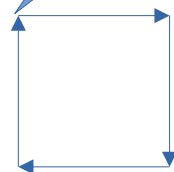

Avoid this
jump stitch

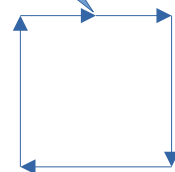

Start from the
middle top so that
the hole can be
done without a
jump stitch

Start and end

Original

New

We will talk about
BBUUpdateNumbers later

With the OutlineOnly flag the design can be steered

- It can be steered to create
 - The first part
 - The second part with
 - Both parts in a single design.
 - Make first design and second design in separate colors
 - This makes the machine stop after the first design so that you can put the fabric to the back

Issue when making a separate first and second design

- The size of the first and second part will be different
 - Leading to the machine placing the design at slightly different places
 - Unless ...

Make a bounding box

Record the
minimum and
maximum
positions

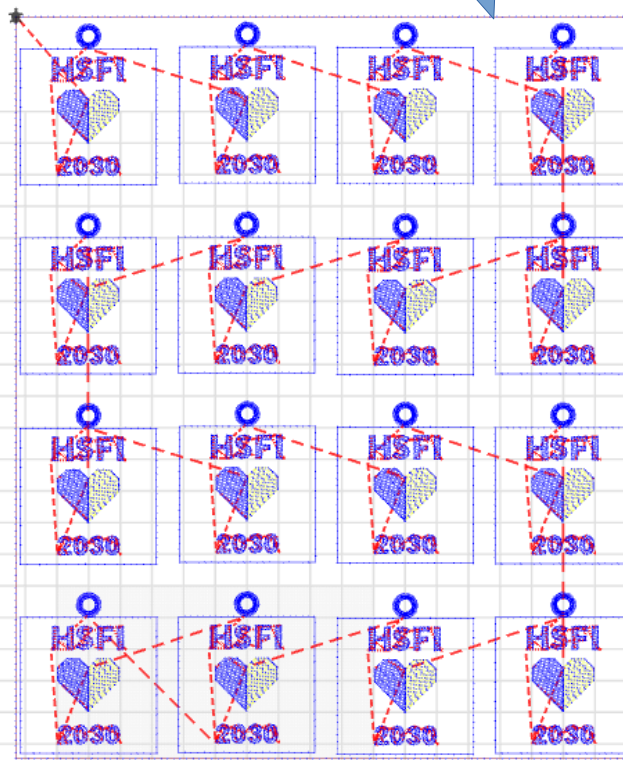

The bounding box at the outside is the same for both the first and the second design.

“Embroider” the bounding box in a different color so that the machine stops. Then do not embroider, but load the second design which will now be embroidered at the right place.

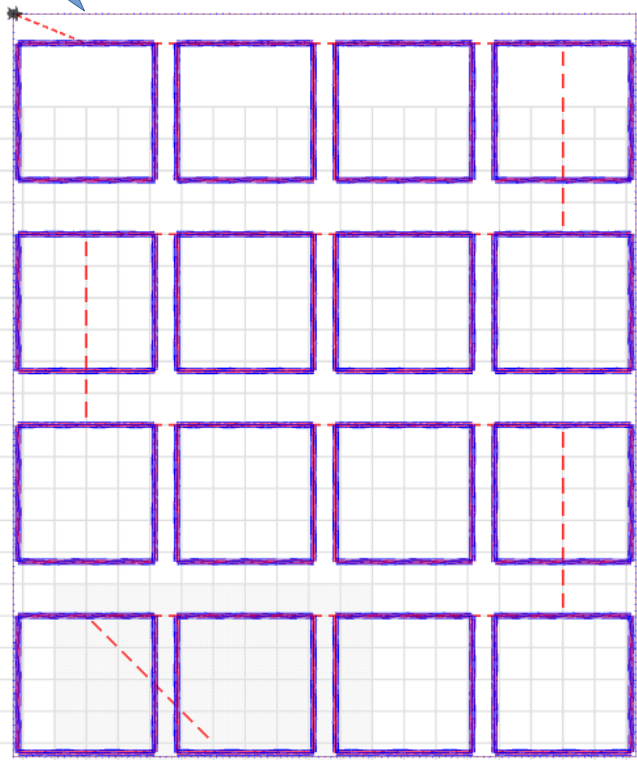

Same bounding
box

Result

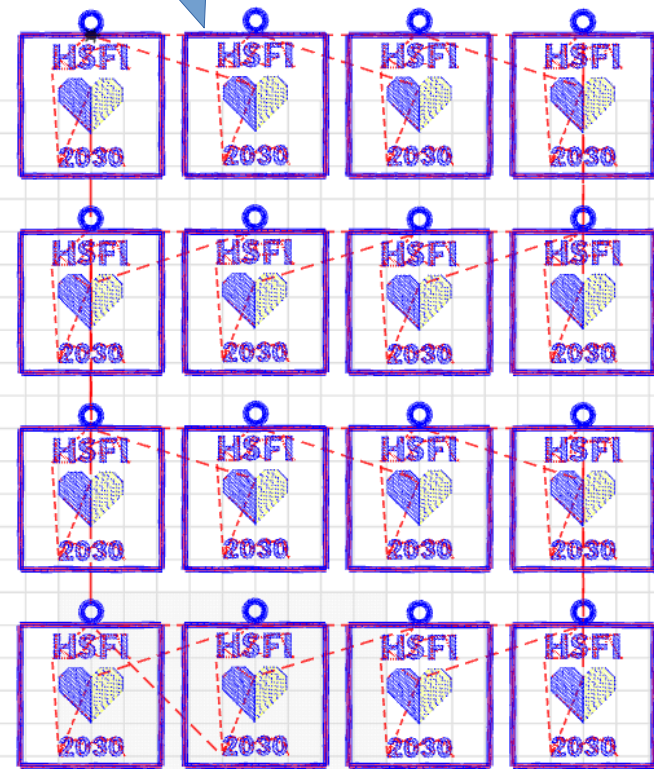

No bounding
box needed

First design

Second design

Combined design

Conclusion

- For repeat designs, make one design without absolute coordinates
 - Then use nested *for* loops to create as many as you want
 - To reduce jump stitch length, consider how you jump from row to row
 - And look at the design to even further reduce jump stitches in the single design
- When designing for backing material applied half way
 - Use the same program, but use a flag to include or exclude or change parts of the design
 - Use color change to stop the machine
 - When splitting into two separate designs, make a bounding box around the designs that are exactly equal to let the embroidery machine position both designs in exactly the same way
